Velvet Hall | WM1 Project Report

Student name: [YOUR NAME] **Student ID:** [YOUR ID]

Project title: Velvet Hall — Interactive Venue Ticketing System
Venue type: Theatre / auditorium

Public GitHub repository: [INSERT PUBLIC REPOSITORY URL]
Public demonstration video: [INSERT ONEDRIVE VIDEO URL]
Exact final commit hash: [INSERT ACTUAL FULL COMMIT HASH]

Venue overview

The venue is a theatre with 234 seats arranged across three pricing zones: Orchestra (64 VIP seats, $120), Mid Hall (90 Premium seats, $85) and Balcony (80 Standard seats, $50). A subset of seats is unavailable to demonstrate booking restrictions.

Main functionality

Dynamic JavaScript-generated seating map; seat inspection and price display; available, inspected, in-cart and unavailable states; explicit Add to Cart; duplicate prevention; cart removal and totals; synchronized map/cart states; localStorage persistence; responsive interface; zoom, four-direction movement and reset controls.

Implementation note

The venue is represented by a JavaScript ZONES array containing each section’s name, rows, seat count per row, category and price. Seat records are generated using array operations, then rendered as individual button elements. Cart state is stored as unique seat identifiers in localStorage and validated when the page loads. Restoring these identifiers updates both the cart display and the corresponding seat appearance.

Bonus claimed

10% optional mouse navigation: mouse-wheel zoom and click/drag panning. All required navigation buttons remain available.

Known issues / limitations

None known from source inspection. Browser acceptance testing and the final demonstration must still be completed by the student.

Final submission check: Replace every bracketed field and screenshot placeholder; verify the public repository, 12 genuine commits over four weeks, video with subtitles, and final commit consistency.
